AUTEX-COM is On Line communication software which was completely developed by Autex in order to exchange orders between a computer and their spreading machines. Our On Line system allows the exchange of information without stopping the machine.

Autex.Com has a database which is perfectly accessible to the Microsoft Access and Excel, so the generated information from our software, can be relationed to other programs like cost management, store management and so on.
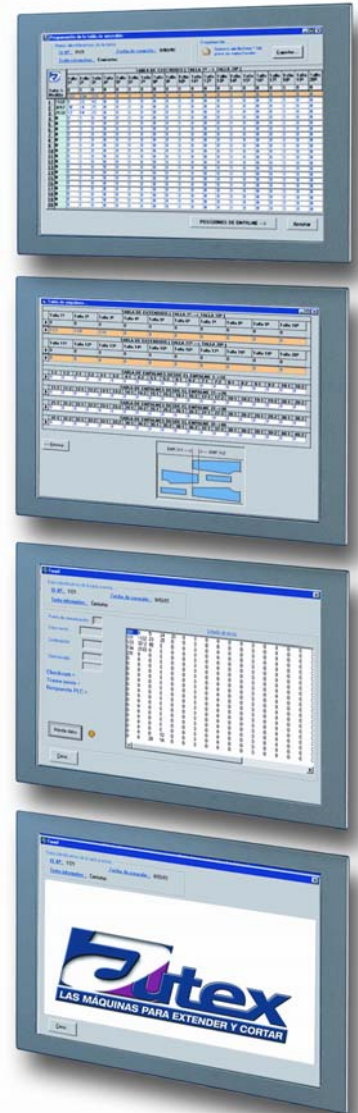

Autex.Com can transmit the spreading orders in article, sizes, measures, colours and quantities directly to the machine.

Autex.Com can inform us the total metres of each fabric roll, and the total metres to each spreading.

Autex.Com can transmit the relevant information to make the junctions, either for the end of the piece or for the elimination of defects.

Autex.Com offer us a report about the spent time in doing any spreading, indicating us the real work time and the stoppages.

Autex.Com can be installed in any computer running under windows.
