CUTTING ARM SYSTEM

VACUM 2100
VACUM TABLE

TALL 2100

Vertical cutting machine with assisted arm with automatic cutting movement during cutting operation and with manual operation by directional handle for long movements.

The assisted arm is provided with a compensating system in double arm with adjustable springs that reduce weight of vertical cutting machine to zero, so that the machine can be left in an elevated position or “parked” above the fabric. With this compensating system it is possible to work perfectly even though the table had irregularities on its surface, increasing the smoothness of movement with less effort and greater accuracy.

More successful cutting is achieved with TALL 2100, as the machine is provided with a small base and with narrower knife and knife guide, thus obtaining smaller and softer turning radius and consequently less movement of the mattress being cut on the table.

Useable width can meet your factory's needs.

The assisted arm can be supplied with cutting machine of 16 or 21cm height.

We reserve the right to make any technical modification.
